**1** Automated design based upon Microprogrammable Bit Slice 77%

#### Microprocessors

Bernard J. Carey , George F. MacLachlan

**Proceedings of the Symposium on Design Automation and Microprocessors**

February 1977

This article will discuss an automated approach to designing digital systems which is based upon the use of System Description Languages (SDL)1,2,3 and Microprogrammable Bit Slice Microprocessors (MBSM)4,5. Both of these concepts have started to reach maturity in recent years with the result that Computer Aided Design (CAD) systems6,7,8 are starting to evolve to a level whereby they may be truly useful in automating certain of t ...

**2** Software fault isolation in wide area networks 77%

Dinesh Gambhir , Ivan Frish , Micheal Post

**Proceedings of the 1992 ACM annual conference on Communications** April 1992

The problem of real-time detection and isolation of errors in distributed software systems operating in a wide-area networked environment is considered. The approach presented combines the results of static software analysis with dynamic event-driven monitoring. Static software analysis is used to generate a model of the distributed system. The model describes all possible executions of the processes composing the distributed system. The event-driven monitoring algorithm upon detecting an e ...
